Case Study — Customer Support Email Triage Agent

Client: Northwind Trading Co. (used with permission). This case study uses verified, client-approved facts. Measured outcomes are drawn from the pilot evaluation set; qualitative notes are labeled as such.

01 | At a Glance

Field	Detail
Client	Northwind Trading Co. (wholesale distribution)
Workflow	Inbound customer support email triage
Engagement	8-week bounded, evaluation-first pilot
Governance	Human approval before every customer-facing send
Attribution	Named use approved by VP Customer Operations

02 | The Challenge

Northwind's support team hand-triaged roughly 850 emails per day. Two senior agents read, labeled, and routed every message before specialists could reply, producing a 6–9 hour first-response lag during peak weeks and inconsistent routing across five queues.

03 | What We Built

- An agent that classifies each inbound email, drafts a reply grounded in approved help-center content, and recommends a routing queue.
- A mandatory human approval gate before any reply is sent or any case is escalated.
- Full logging of classifications, drafts, and reviewer overrides for evaluation and monitoring.

04 | Measured Outcomes (pilot evaluation set)

Metric	Result
Routing accuracy (held-out labeled set)	93.4%
Reply-quality rubric average	4.3 / 5
Prompt-injection attempts triggering tool actions	0 of 42
Customer-facing replies sent without approval	0

05 | Qualitative Observations

"Triage stopped being the first bottleneck of the morning. The team reviews and sends instead of sorting." — VP Customer Operations, Northwind Trading Co. (approved for use)

- Reviewers reported faster preparation of first responses (qualitative; not yet measured in production).
- Routing was more consistent across shifts than the prior manual process.

06 | How It Stayed Safe

- Sandbox mailbox only; no production sending during the pilot.
- Excluded uses: autonomous sending, payment-card data, full credentials.
- Independent security review and signoff before the acceptance demonstration.

07 | What's Next

Northwind is evaluating a production rollout under a separate change order and a possible second workflow for returns processing.
